ABSTRACT

A fluid applicator bottle includes an elongated hollow body having a longitudinal axis. The hollow body is arranged to hold a liquid therein and includes a shoulder portion, a central recessed portion, and a bottom portion. The central recessed portion includes a side wall section having an approximately triangular cross-section with a first side, a second side, and a base side. A groove extends in the central recessed portion. The groove forms a finger contact surface for contact by a tip of a user's finger during liquid application.
